2.2 – Empathy Map Canvas

An empathy map is a teamwork tool that helps us understand a type of user.

It shows what we know about users so we can all be on the page about their needs and make better decisions.

This comes from Nielsen Norman Group. In words an empathy map is a one-page diagram. It helps you imagine being, in someone Place and seeing things from their point of view.

You write down what users really see, hear, think, feel, say and do. You also note their problems and benefits. The empathy map was created by Scott Matthews in 2010. He made it to help teams understand their users better. Later it became popular when Dave Gray included it in his book Game storming.

The canvas is divided into four quadrants with a space representing the user the person who will be using the tool. The four main sections are about what the user Says, what the user Thinks, what the user Does and what the user Feels.

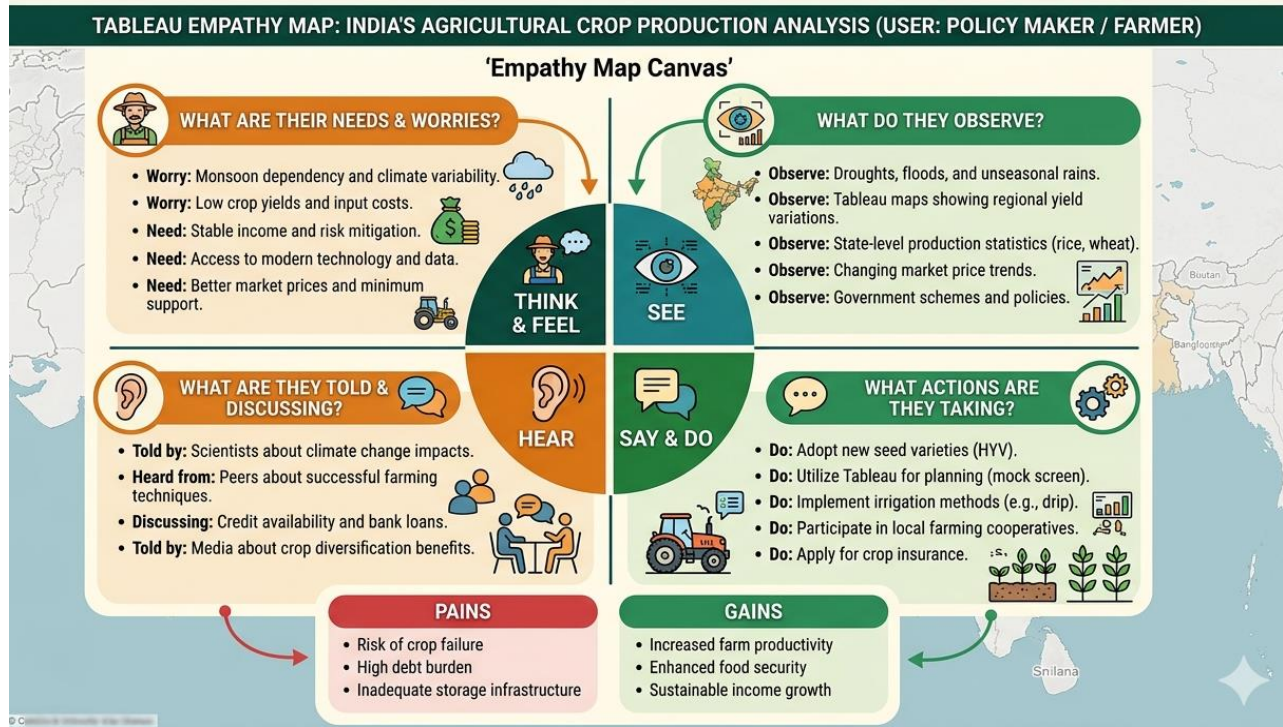

Modern versions, like the one we built expand this to six zones by adding what the user Sees, what the user Hears, what Pains the user has and what Gains the user wants for an understanding of the user.

An empathy map is a tool that helps product teams understand their users better. It encourages designers to create designs that focus on the user's needs.

When we apply this to our project before making a Tableau dashboard for analysing crop production an empathy map helps us figure out: Who will actually use this dashboard? What problems do they face? What choices do they need to make? If we skip this step we might end up with a dashboard that works technically but is not useful in life.

India's Agricultural Crop Production Analysis using Tableau

A classic empathy map used in design thinking has a picture of the user in the middle. It is surrounded by four sections that help teams see the user as a person. Including their feelings reasons, for doing things, actions and thoughts.
