PROJECT TITLE	India's Agricultural Crop Production Analysis using Tableau
MAX MARKS	4 MARKS

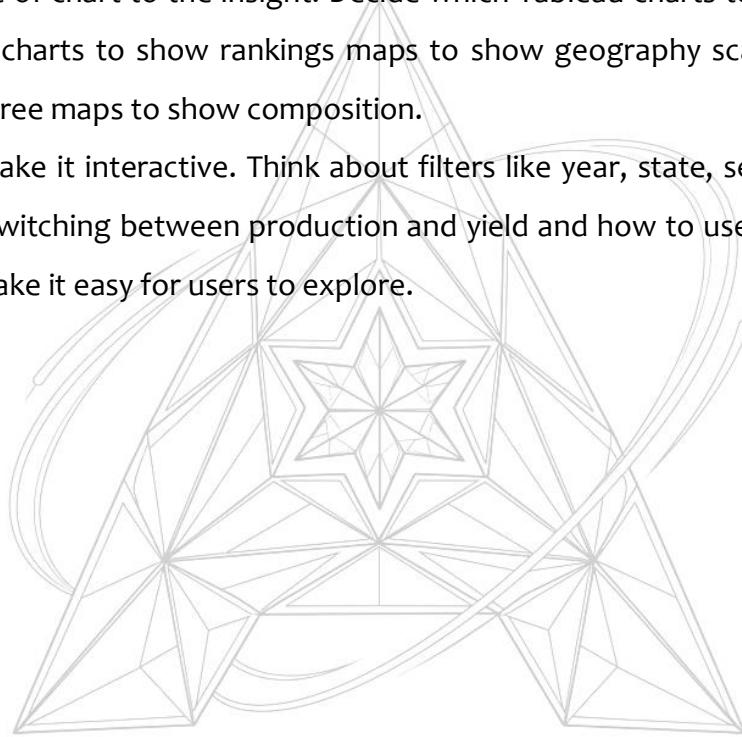

2.3 – Brainstorming

Brainstorming is a way to think creatively and come up with a lot of ideas to solve a problem quickly. The main idea is that the ideas you have the better chance you have of finding something really useful. Brainstorming helps you think outside the box by asking questions like "What if?". Why not?" to explore different possibilities and find challenges and opportunities that you might not have thought of before. You can do brainstorming by yourself or with a group of people. It is a great way to start planning and analyzing things.

Key points of Brainstorming:

1. Figure out what you want to achieve. Be clear about what you want to do look at trends in production compare how things are different in seasons like Kharif, Rabi and Summer or study what affects how much you produce.
2. Identify the people who are involved. Make a list of all the people who are affected: government policymakers, farmers, agribusinesses, people who manage supply chains, researchers and the media. Understand what each of them needs.
3. Come up with questions. Think of questions like: which state produces the most, which season is the best is production going up and how does rainfall affect production.
4. Look at all the factors. Identify all the things that can affect production: the state, the district, the type of crop the season, the year how much is produced the area, the yield, rainfall, fertilizer, pesticide and irrigation.
5. Think about where to get the information. Consider sources: the Indian government APS database, Kaggle, data.gov.in and the websites of state agriculture departments.

6. Come up with ways to calculate things. Plan to calculate things like yield how much production is increasing each year and what percentage of production happens in each season.
7. Anticipate problems with the data. Identify issues like missing information, names for crops, different units and outliers. And brainstorm solutions for each problem.
8. Match the type of chart to the insight. Decide which Tableau charts to use line charts to show trends bar charts to show rankings maps to show geography scatter plots to show correlations and tree maps to show composition.
9. Plan how to make it interactive. Think about filters like year, state, season and crop and parameters like switching between production and yield and how to use dashboard actions and tooltips to make it easy for users to explore.
