

9.2 – Disadvantages

1. Persistent Productivity Gaps: India is producing a lot of food. The country is still facing big problems with productivity. The yields of crops like maize, pulses and soybean are not as good as they are in other countries. This is because farmers in India are using methods, they do not have access to the latest technology and they cannot get good quality seeds and other inputs. All these things together are preventing India from producing much food as it can.

2. Climate. Ecological Degradation: The weather in India is becoming very unpredictable. This is affecting the crops. Even small changes in the monsoon season can cause drops in crop production. At the time the environment is getting damaged very badly. The soil is losing its fertility the fertilizers are not working well as they should and the water table is going down very fast. This is causing an environmental problem.

3. Farmer Income Distress: The biggest problem is that farmers in India are not earning money. The prices of crops are very low. Farmers are not getting the minimum support price. This means that farmers are not earning much as people who work in other jobs. This is causing a lot of poverty in areas people are moving to cities and farmers are getting into debt. This is making it very hard for farmers to make a living.

4. Water Scarcity and Unequal Irrigation Coverage: India has a problem with water. Some areas have little water and this is affecting the crops. The areas that grow millet and other crops that need rain are the affected. On the hand the areas that grow rice have a lot of water. This is causing an imbalance and it is affecting the farmers who do not have enough water.

5. Input Distortions and Subsidy Imbalances: The government is giving a lot of subsidies to farmers. This is causing more problems. The subsidies are not balanced. This is affecting the soil. The fertilizers are not being used in the way and this is damaging the soil. This is also causing price distortions and it is not encouraging farmers to use the right inputs.

6. Inadequate Post-Harvest Infrastructure: India does not have storage facilities and this is causing a lot of waste. The crops are not being stored properly. This is causing big losses. India

is not processing its crops like countries and this is causing a lot of problems. This is also affecting the farmers who are not getting the price for their crops.

7. Fragmented Landholdings and Limited Mechanization: The farms in India are getting smaller and smaller. This is causing problems because farmers cannot produce as much food as they can. The small farmers do not have the money to buy machines and this is affecting their productivity. This is causing a cycle of low productivity and it is affecting the farmers very badly.

8. Market Integration and Price Volatility: The markets in India are not integrated and this is causing big problems. The prices of crops are very volatile. This is affecting the farmers. The farmers are not getting the price for their crops and this is causing a lot of problems. The farmers are also being exploited by the middlemen. This is causing a lot of distress.

9. High Credit Costs and Rising NPAs: The farmers in India are not getting the credit and this is causing big problems. The interest rates are very high. This is affecting the farmers. The farmers are not able to repay their loans. This is causing a lot of distress. This is also affecting the banks. It is causing a big problem.

10. Inadequate Research-Application Linkages: India has a lot of research institutions. The research is not being used in the right way. The scientists are doing a lot of research. It is not being applied in the fields. This is causing a gap and it is affecting the farmers. The farmers are not getting the technology and this is affecting their productivity.
