

CHAPTER – 01

INTRODUCTION

1.1 – Project Overview

Agriculture is an important part of the Indian economy. It helps a lot of people get jobs and have food to eat. More than half of the people in India depend on agriculture to make a living. The amount of food we grow is different in different parts of the country. This is because of things like the weather how rain we get, the kind of soil we have and what the government does to help. So, it is very important to understand how food we are growing and how different areas are doing. This will help us plan and make sure we have food for everyone.

The project "Indias Agricultural Crop Production Analysis using Tableau" wants to take a lot of information about agriculture and make it easy to understand. We are using Tableau to look at data from states and seasons to see how much food we are growing. We want to find out which areas are doing well and which are not. We also want to see how the amount of food we grow changes during times of the year.

We are making pictures and charts to help us see what is going on. These pictures will show us things like which foods we grow the most, which states are the best at growing food and how the weather affects what we grow. We can also see how well we are using our land to grow food.

By making it easy to see what is going on with agriculture we can help people make decisions. This will help farmers, the people who make rules and the people who study agriculture. They can use this information to make sure we have food and that we are growing it in a way that is good, for everyone. This will help Indias agriculture get better and better.
