

1.2 – Purpose of the Project

The main goal of this project is to use Tableau to change agricultural data into a story that people can see and understand. India's economy really depends on agriculture and most people in the country work in this field. However, there are problems like weird weather and markets that keep changing.

This project helps by taking all the information and making it simple and easy to see. It does this by moving from lots of complicated data in Excel to simple pictures that people like farmers, companies and leaders can look at and make decisions from.

The project uses boards that show information in a way that is easy to understand. It looks for patterns in the data that can help figure out why some places grow food than others. It also looks at how much of crops like rice, wheat and cotton are grown over time. It sees how things like droughts or new technologies affect these crops. It even looks at how different areas of the countries doing and finds places that are not growing as much food as they could be. This helps people see where they need to make changes like using seeds or watering systems.

The project is a tool that helps people make decisions about agriculture. It lets them look at information by state, crop and year. This helps them see how things change during seasons. It also helps them see which seasons are most affected by climate change and which crops are most stable. This information can help farmers plan what to grow and when. It can help companies decide how to use their resources.

It can help leaders make good decisions, about agriculture. The main idea is to show where Indian agriculture is now and how it can be improved. The project uses Tableau to make Indian agricultural data easy to see and understand. Indian agricultural data is used to make this story.
