PROJECT TITLE	India's Agricultural Crop Production Analysis using Tableau
MAX MARKS	2 MARKS

CHAPTER – III

REQUIREMENT ANALYSIS

3.1 – Customer Journey Map

A Customer Journey Map is an useful tool for people who design things and study how users feel. It is a document that shows what a user goes through from the moment they find out about a product or system to the point where they tell others about it.

The word "customer" in Customer Journey Map does not just mean someone who buys things. It means anyone who uses a system to get something done. This could be a business product, a government system, a tool for research or something like Tableau.

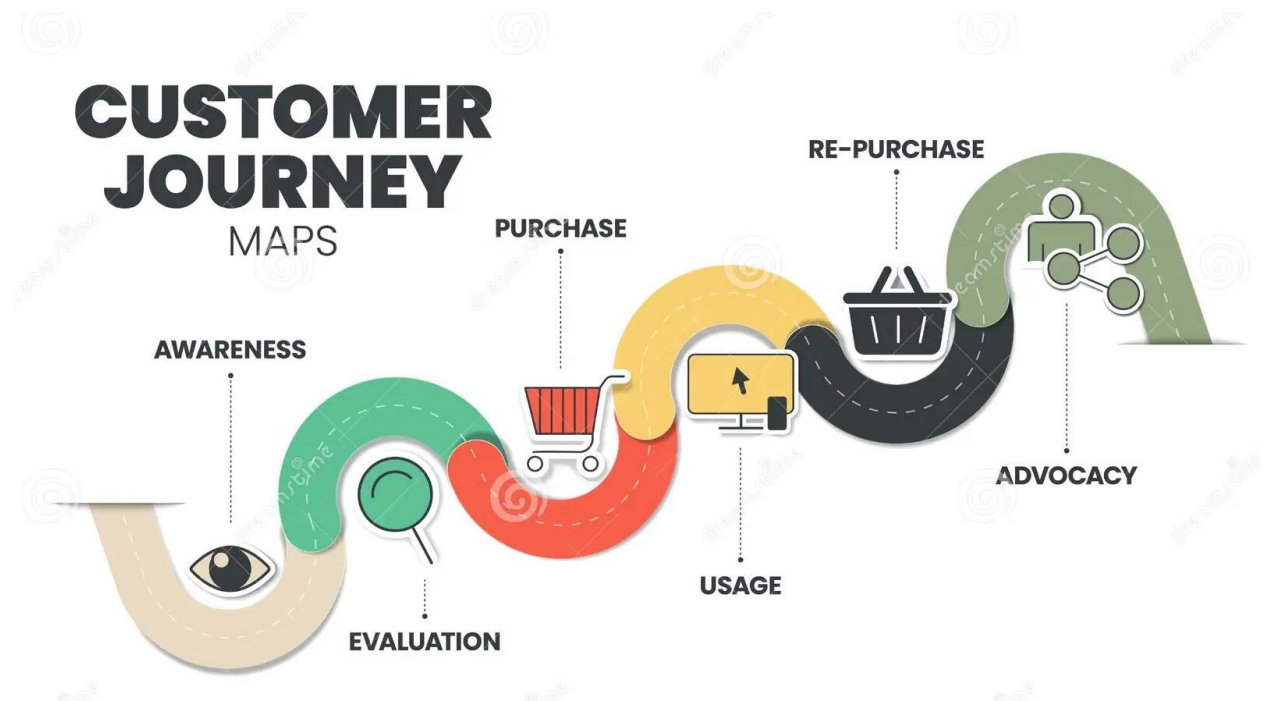

For example, when we talk about Indias Agricultural Crop Production Analysis using Tableau the customer is someone like an agricultural data analyst, a government policy maker or an agricultural researcher who uses Tableau to understand crop production and make decisions.

The Customer Journey Map helps answer a question that seems easy but is actually very hard to answer: what does the user really feel and experience at every step when they use this system?

Most projects are made by thinking about what's inside. The people who make things think about what features to add. The managers think about what they want to get done. The policy makers think about what they want to achieve.

The users see the system from the outside and they feel things, like frustration, confusion and happiness that the people who made the system did not expect. A Customer

Journey Map helps fix this problem by making everyone think about what the user feels at every step. It makes them put themselves in the user's shoes and see things from their point of view.

Awareness – Customer realizes a need and discovers the brand through ads, social media, or word-of-mouth.

Evaluation – Customer compares features, pricing, and reviews to find the best option.

Purchase – Customer completes the transaction, influenced by pricing and easy checkout.

Usage – Customer experiences the product, with onboarding and support shaping satisfaction.

Re-Purchase – Satisfied customers return to buy again, reflecting trust and loyalty.

Advocacy – Loyal customers recommend the brand through reviews and referrals.
